## About this review

For 63 years, the *BP Statistical Review of World Energy* has provided high-quality objective and globally consistent data on world energy markets. The review is one of the most widely respected and authoritative publications in the field of energy economics, used for reference by the media, academia, world governments and energy companies. A new edition is published every June.

## Find more online

The *BP Statistical Review of World Energy 2014* is available online at [bp.com/statisticalreview](http://bp.com/statisticalreview)

### Key information

The website contains all the tables and charts found in the latest printed edition, plus a number of extras, including:

- Historical data from 1965 for many sections.
- Additional data for natural gas, coal, hydroelectricity, nuclear energy, electricity and renewables.
- An oil, natural gas and LNG conversion calculator.
- PDF versions and PowerPoint slide packs of the charts, maps and graphs, plus an Excel workbook of the data.
- Regional factsheets.
- Videos and speeches.

### Other features include:

#### Energy economics blog

Regular blogs on energy economics.  
[bp.com/energyeconomics](http://bp.com/energyeconomics)

#### Energy Outlook

Watch the BP Energy Outlook 2035 – January 2014 video, containing our projections of long-term energy trends.  
[bp.com/energyoutlook](http://bp.com/energyoutlook)

#### Charting tool

You can view predetermined reports or chart specific data according to energy type, region and year.  
[bp.com/statisticalreview](http://bp.com/statisticalreview)

#### Join the conversation

### Disclaimer

The data series for proved oil and gas reserves in *BP Statistical Review of World Energy June 2014* does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance, under UK accounting rules contained in the Statement of Recommended Practice, 'Accounting for Oil and Gas Exploration, Development, Production and Decommissioning Activities' (UK SORP) or as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country. Rather, the data series has been compiled using a combination of primary official sources and third-party data.

# Group chief executive's introduction

## Energy in 2013 – energy markets reflect broader themes.

Welcome to the 63rd edition of the *BP Statistical Review of World Energy*.

The world of energy in 2013 echoed broader global themes – such as emerging differences in global economic performance, geopolitical uncertainty and ongoing debates about the proper roles of government and markets.

These are important issues, and ones over which opinions vary widely, and legitimately. It has been said that everyone is entitled to their own opinion, but not their own facts. And that is where the Statistical Review comes in: since 1952, its mission has always been to provide objective, global data on energy markets to inform discussion, debate and decision-making. This first snap-shot of the global energy picture in 2013 – together with the historical data that puts today's information into context – can help us to understand how the world around us is changing.

The year 2013 saw an acceleration in the growth of global energy consumption, despite a stagnant global economy. Economic growth remained weak nearly everywhere and relative to recent history it was weaker in the emerging non-OECD economies. In line with that economic pattern, energy consumption growth was below average in the non-OECD, driven by China, and above average in the mature economies of the OECD, driven by the US. Emerging economies nonetheless continue to dominate global energy demand, accounting for 80% of growth last year and nearly 100% of growth over the past decade.

While consumption growth accelerated globally, it has remained below average – this is again, consistent with the weak global economic picture. Regionally, energy consumption growth was below average everywhere except North America. EU consumption continued to decline, hitting the lowest level since 1995 (despite economic growth of 35% over this period).

Energy production continued to be impacted by geopolitical events. Oil production in Libya suffered the world's largest decline in the face of renewed civil unrest and the production of oil and gas was disrupted in a number of other countries as well. In the face of these disruptions and heightened risks to supply, average oil prices exceeded \$100 per barrel for a third consecutive year, despite massive supply growth in the US.

Supply developments also highlighted the importance of our third topic, namely to get the balance right between policy and market forces. Driven by massive investment in shale and other 'tight' formations, the US saw the world's largest increase in oil production last year, offsetting the numerous disruptions seen elsewhere and

keeping prices stable. Indeed, the US increase in 2013 was one of the biggest oil production increases the world has ever seen.

Elsewhere, and after global coal prices have fallen for two years in a row, coal is extending its competitive edge in power generation and the competitive balance has begun to shift. Coal was the fastest-growing fossil fuel, with China and India combined accounting for 88% of global growth, while natural gas consumption growth decelerated and grew at a below-average rate. As was the case for total energy, gas consumption growth was below average in all regions except North America, which continues to enjoy the cheapest prices among international markets.

The importance of policy is also apparent in the strength of renewable forms of energy, which continued to grow robustly, albeit from a low base. Renewables now account for more than 5% of global power output and nearly 3% of primary energy consumption. The challenge of sustaining expensive subsidy regimes, however, has become visible where penetration rates are highest, namely the below-average growth of Europe's leading renewable producers, who are grappling with weak economic growth and strained budgets.

Once again, the data in this review shows a flexible global energy system adapting to a changing world. It demonstrates how the world's quest for secure and fairly-priced energy can be met through competitive industries driving innovation and smart government policies that amplify the creative 'energy'. At BP we remain focused on how to lead this process, delivering the growing energy requirements of our customers, safely and sustainably. We do this by investing in our people and world-leading technology, while exercising the capital discipline sought by our investors.

I hope you will find this year's Statistical Review a useful resource for a global perspective on energy.

In concluding, let me thank BP's economics team and all those around the world who have helped prepare this review – in particular those in governments in many countries who contribute their official data.

A handwritten signature in black ink that reads "Bob Dudley".

**Bob Dudley**  
Group Chief Executive  
June 2014

# 2013 in review

Global primary energy consumption accelerated in 2013 despite stagnant global economic growth.

▲ China's Hong Kong skyline. China was the world's largest producer and consumer of energy overall in 2013.

▼ The Octavio Frias de Oliveira Bridge in Brazil – 24% of the world's biofuels were produced in the country in 2013, making it the second largest producer.

## +2.3%

Growth in global primary energy consumption.

Consumption and production increased for all fuels, reaching record levels for every fuel type except nuclear power. For each of the fossil fuels, global consumption rose more rapidly than production. The data suggests that growth in global CO<sub>2</sub> emissions from energy use also accelerated in 2013, although it remained below average.

Emerging economies dominated global growth again, but the increase was below the ten-year average in these countries, and above average in the OECD. China once again had the largest growth increment, followed by the US. Consumption in the EU and Japan fell to the lowest levels since 1995 and 1993 respectively.

Energy price developments in 2013 were mixed, generally rising in North America (except for coal) and falling elsewhere. The annual average price for Brent, the international crude oil benchmark, declined for the first time since 2009 but remained near record levels (in money-of-the-day as well as inflation-adjusted terms). This was the third consecutive year with the Brent average price above \$100 per barrel. Crude oil prices weakened in early 2013 amid strong growth of oil production in the US, but rebounded later in the year due to a range of supply disruptions and cold weather that boosted demand growth. The differential between Brent and the US benchmark West Texas Intermediate (WTI) narrowed but remained elevated.

Natural gas prices rose in North America (for the first time since 2010) and the UK, but fell elsewhere. As with Brent – WTI, differentials between North American and international gas prices generally narrowed but remained elevated. Coal prices declined in all regions for a second consecutive year.

### Energy developments

Global primary energy consumption increased by 2.3% in 2013, an acceleration over 2012 (+1.8%). Growth in 2013 accelerated for oil, coal, and nuclear power. But global growth remained below the 10-year average of 2.5%. All fuels except oil, nuclear power and renewables in power generation grew at below-average rates. Growth was below average for all regions except North America. Oil remains the world's leading fuel, with 32.9% of global energy consumption, but it also continued to lose market share for the fourteenth consecutive year and its current market share is once again the lowest in our data set, which begins in 1965.

Emerging economies accounted for 80% of the global increase in energy consumption – even though growth in these countries was a below average 3.1%. OECD consumption rose by an above-average 1.2%. Robust US growth (+2.9%) accounted for all of the net increase in the OECD and consumption in the EU and Japan fell by 0.3% and 0.6%, respectively. Spain (-5%) recorded the largest volumetric decline in energy consumption.

## +1.1m b/d

Growth of US oil production, the largest in the world.

## 7m b/d

China's net oil imports, the world's largest.

### Prices

Dated Brent averaged \$108.66 per barrel in 2013, a decline of \$3.01 per barrel from the 2012 level. WTI continued to trade at a large discount to Brent (\$10.67 per barrel), driven by growing US production. Since 2011, the WTI discount has averaged \$14.81 per barrel, compared with an average premium of \$1.39 per barrel for the preceding decade.

### Consumption and production

Global oil consumption grew by 1.4 million barrels per day (b/d), or 1.4% – this is just above the historical average. Countries outside the OECD now account for the majority (51%) of global oil consumption and they once again accounted for all of the net growth in global consumption. OECD consumption declined by 0.4%, the seventh decrease in the past eight years. The US (+400,000 b/d) recorded the largest increment to global oil consumption in 2013, outpacing Chinese growth (+390,000 b/d) for the first time since 1999. Light distillates were the fastest-growing refined product category by volume.

Global oil production did not keep pace with the growth in global consumption, rising by just 560,000 b/d or 0.6%. The US (+1.1 million b/d) recorded the largest growth in the world and the largest annual increment in the country's history for a second consecutive year. The US accounted for nearly all (96%) of the non-OPEC output increase of 1.2 million b/d (the strongest since 2002) to reach a record 50 million b/d. Increases in Canada (+210,000 b/d) and Russia (+150,000 b/d) offset declines in Syria (-120,000 b/d), the

UK and Norway (-80,000 b/d each) and Australia (-70,000 b/d). OPEC output fell by 600,000 b/d, the first decline since 2009. Declines in Libya (-520,000 b/d), Iran (-190,000 b/d), Saudi Arabia (-110,000 b/d) and Nigeria (-100,000 b/d) outweighed an increase in the UAE (+250,000 b/d).

### Refining and trade

Global refinery crude runs increased by a below-average 390,000 b/d or 0.5%. Non-OECD countries accounted for all of the net increase, rising by 730,000 b/d. OECD throughputs declined by 340,000 b/d, the seventh decline in the past nine years despite an increase of 320,000 b/d in US refinery runs, as the US continued to ramp up net product exports. Global refinery capacity utilization declined to 80.4%, the lowest since 1987, while global refining capacity increased by a robust 1.4 million b/d, with large capacity additions in China and Saudi Arabia outpacing capacity reductions in the Atlantic Basin and Japan.

Global oil trade in 2013 grew by 2.1% or 1.2 million b/d – among importers, growth in Europe and emerging economies more than offset declines in the US and Japan. At 56.5 million b/d, trade accounted for 61.8% of global consumption, up from 58.3% a decade ago. US net imports fell by 1.4 million b/d to 6.5 million b/d – just over half the level of net imports seen in 2005 and the lowest level since 1988. China's net oil imports reached 7 million b/d, surpassing the US as the world's largest net oil importer.

▶ The Trans-Alaska Pipeline is more than 800 miles long and transports oil between Prudhoe Bay and Valdez in the US.

# 🔥 Natural gas

## +2.7%

Growth in North American gas consumption, the only region with above-average growth.

## +1.1%

Growth in global gas production.

▼ The *Min Rong* tanker berthed at Tangguh liquefied natural gas (LNG) plant in Indonesia. Indonesia is the second largest natural gas producer in Asia.

▲ The Shah Deniz platform in the Caspian Sea. Natural gas is the leading fuel in Europe and Eurasia.

## Consumption and production

World natural gas consumption grew by 1.4%, below the historical average of 2.6%. And, as was the case for primary energy, consumption growth was above average in the OECD countries (+1.8%) and below average outside the OECD (+1.1%). Growth was below average in every region except North America. China (+10.8%) and the US (+2.4%) recorded the largest growth increments in the world, together accounting for 81% of global growth. India (-12.2%) recorded the largest volumetric decline in the world, while EU gas consumption fell to the lowest level since 1999. Globally, natural gas accounted for 23.7% of primary energy consumption.

Global natural gas production grew by 1.1%, which was well below the 10-year average of 2.5%. Growth was below average in all regions except Europe and Eurasia. The US (+1.3%) remained the world's leading producer, but both Russia (+2.4%) and China (+9.5%) recorded larger growth increments in 2013. Nigeria (-16.4%), India (-16.3%), and Norway (-5%) recorded the largest volumetric declines.

## Trade

Global natural gas trade grew by 1.8% in 2013, well below the historical average of 5.2%. Pipeline shipments grew by 2.3%, driven by a 12% increase in net Russian exports, which offset declines in Algeria (-17.9%), Norway (-4.5%) and Canada (-5.5%). Among importers, growth in Germany (+14%) and China (+32.4%) more than offset a continued decline in the US (-10.9%). Global LNG trade rebounded by 0.6% in 2013. Increased imports in South Korea (+10.7%), China (+22.9%), and South and Central American importers (+44.7%) were partially offset by lower imports in Spain (-35.6%), the UK (-31.9%) and France (-19.4%). Qatar remained the largest LNG exporter (32% of global exports), and accounted for the largest growth increment (+2.7%). LNG's share of global gas trade declined slightly to 31.4% – and international natural gas trade accounted for 30.9% of global consumption.

▲ Goshen Wind Farm in Idaho. Global wind power generation grew by 21% in 2013.

▶ Coal ready for shipping. Coal was the fastest growing fossil fuel and its consumption grew by 3% in 2013.

**+3.0%**

Growth in global coal consumption, the fastest growing fossil fuel.

**+0.9%**

Growth in global nuclear output, the first increase since 2010.

**5.3%**

Share of global power generation met by renewables.

 **In detail**

Additional information – including historical time series for the fuels reported in this review; further detail on renewable forms of energy; electricity generation; and CO<sub>2</sub> emissions from energy use – is available at [bp.com/statisticalreview](http://bp.com/statisticalreview)

**Coal**

Coal consumption grew by 3% in 2013, well below the 10-year average of 3.9% but it is still the fastest-growing fossil fuel. Coal's share of global primary energy consumption reached 30.1%, the highest since 1970. Consumption outside the OECD rose by a below-average 3.7%, but still accounted for 89% of global growth. China recorded the weakest absolute growth since 2008 but the country still accounted for 67% of global growth. India experienced its second largest volumetric increase on record and accounted for 21% of global growth. OECD consumption increased by 1.4%, with increases in the US and Japan offsetting declines in the EU. Global coal production grew by 0.8%, the weakest growth since 2002. Indonesia (+9.4%) and Australia (+7.3%) offset a decline in the US (-3.1%), while China (+1.2%) recorded the weakest volumetric growth in production since 2000.

**Nuclear and hydroelectric**

Global nuclear output grew by 0.9%, the first increase since 2010. Increases in the US, China and Canada were partly offset by declines in South Korea, Ukraine, Spain and Russia. Japanese output fell by 18.6% and has fallen by 95% since 2010. Nuclear output accounted for 4.4% of global energy consumption, the smallest share since 1984.

Global hydroelectric output grew by a below-average 2.9%. Led by China and India, the Asia-Pacific region accounted for 78% of global growth. Drought conditions reduced output in Brazil by 7% and in Finland, Norway and Sweden by a combined 14.5%. Hydroelectric output accounted for 6.7% of global energy consumption.

**Renewables**

Renewable energy sources – in power generation as well as transport – continued to increase in 2013, reaching a record 2.7% of global energy consumption, up from 0.8% a decade ago. Renewable energy used in power generation grew by 16.3% and accounted for a record 5.3% of global power generation. China recorded the largest incremental growth in renewables, followed by the US, while growth in Europe's leading players – Germany, Spain and Italy – was below average. Globally, wind energy (+20.7%) once again accounted for more than half of renewable power generation growth and solar power generation grew even more rapidly (+33%), but from a smaller base. Global biofuels production grew by a below-average 6.1% (80,000 b/doe), driven by increases in the two largest producers: Brazil (+16.8%) and the US (+4.6%).

**Notes: Proved reserves of oil** – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions.

**Reserves-to-production (R/P) ratio** – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

**Source of data** – The estimates in this table have been compiled using a combination of primary official sources, third-party data from the OPEC Secretariat, *World Oil*, *Oil & Gas Journal* and an independent estimate of Russian and Chinese reserves based on information in the public domain.

Canadian oil sands 'under active development' are an official estimate. Venezuelan Orinoco Belt reserves are based on the OPEC Secretariat and government announcements.

**Reserves include gas condensate and natural gas liquids (NGLs) as well as crude oil.**

**Shares of total and R/P ratios are calculated using thousand million barrels figures.**

## Reserves-to-production (R/P) ratios

Years

### 2013 by region

### History

Total world proved oil reserves reached 1687.9 billion barrels at the end of 2013, sufficient to meet 53.3 years of global production. The largest additions to reserves came from Russia, adding 900 million barrels and Venezuela adding 800 million barrels. OPEC members continue to hold the majority of reserves, accounting for 71.9% of the global total. South & Central America continues to hold the highest R/P ratio. Over the past decade, global proved reserves have increased by 27%, or over 350 billion barrels.

## Distribution of proved reserves in 1993, 2003 and 2013

Percentage

- Middle East
- S. & Cent. America
- North America
- Europe & Eurasia
- Africa
- Asia Pacific

### Production by region

Million barrels daily

### Consumption by region

Million barrels daily

World oil production increased by just 560,000 b/d in 2013, less than half the growth of global consumption. Global consumption grew by an above-average 1.4 million b/d, with emerging economies accounting for all of the net increase. Even so, the US had the biggest increase in the world for consumption, as well as production, which grew by 400,000 b/d and 1.1 million b/d respectively. OPEC output fell by 600,000 b/d, driven by a decline of 520,000 b/d in Libya.

### Consumption per capita 2013

## Refinery utilization

Percentage

Global crude runs grew by 0.4 million b/d in 2013, with increases in China, India and the US more than offsetting declines in Europe and Other Asia Pacific. Global refining capacity grew by 1.4 million b/d, led by additions in China and the Middle East. Global average refinery utilization slipped to 80.4%, the lowest since 1987.

## Regional refining margins

US dollars per barrel

**Note:** The refining margins presented are benchmark margins for three major global refining centres: US Gulf Coast (USGC), North West Europe (NWE – Rotterdam) and Singapore. In each case they are based on a single crude oil appropriate for that region and have optimized product yields based on a generic refinery configuration (cracking, hydrocracking or coking), again appropriate for that region. The margins are on a semi-variable basis, i.e. the margin after all variable costs and fixed energy costs.

n/a not available.

**Notes: Proved reserves of natural gas** – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions.

**Reserves-to-production (R/P) ratio** – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

**Source of data** – The estimates in this table have been compiled using a combination of primary official sources and third-party data from Cedigaz and the OPEC Secretariat.

## Reserves-to-production (R/P) ratios

Years

### 2013 by region

### History

World proved natural gas reserves at end-2013 stood at 185.7 trillion cubic metres (tcm), sufficient to meet 55.1 years of global production. Proved reserves grew by 0.2% relative to end-2012 data. An increase in the US (+7.1%) accounted for all of the net growth in global proved reserves in 2013. Iran (33.8 tcm) and Russia (31.3 tcm) hold the largest proved reserves.

## Distribution of proved reserves in 1993, 2003 and 2013

Percentage

- Middle East
- Europe & Eurasia
- Asia Pacific
- Africa
- North America
- S. & Cent. America

\*Excluding gas flared or recycled. Includes natural gas produced for Gas-to-Liquids transformation.

Source: Includes data from Cedigaz.

•Less than 0.05%.

Notes: As far as possible, the data above represents standard cubic metres (measured at 15°C and 1013 mbar); as they are derived directly from tonnes of oil equivalent using an average conversion factor, they do not necessarily equate with gas volumes expressed in specific national terms.

Annual changes and shares of total are calculated using million tonnes of oil equivalent figures.

Natural gas production data expressed in billion cubic feet per day is available at [bp.com/statisticalreview](http://bp.com/statisticalreview)

Growth rates are adjusted for leap years.

### Production by region

Billion cubic metres

### Consumption by region

Billion cubic metres

World natural gas production increased by 1.1% in 2013, slightly below the growth rate of global consumption (+1.4%). Production growth was below average in all regions except Europe & Eurasia. Russia (+2.4%) and China (+9.5%) recorded the largest growth increments. Consumption growth was below average in all regions except North America. China (+10.8%) and the US (+2.4%) recorded the largest growth increments.

### Consumption per capita 2013

Tonnes oil equivalent

Source of reserves data: World Energy Resources 2013 Survey, World Energy Council.

**Notes: Proved reserves of coal** – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known deposits under existing economic and operating conditions.

**Reserves-to-production (R/P) ratio** – If the reserves remaining at the end of the year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

**Prices**

## Reserves-to-production (R/P) ratios

Years

### 2013 by region

### History

World proved coal reserves in 2013 were sufficient to meet 113 years of global production, by far the largest R/P ratio for any fossil fuel. The US, Russia and China hold the largest proved reserves. By region, Europe & Eurasia holds the largest proved reserves and has the highest R/P ratio – 254 years, compared with 250 for North America.

## Distribution of proved reserves in 1993, 2003 and 2013

Percentage

- Europe & Eurasia
- Asia Pacific
- North America
- Middle East & Africa
- S. & Cent. America

\*Commercial solid fuels only, i.e. bituminous coal and anthracite (hard coal), and lignite and brown (sub-bituminous) coal. Excludes coal converted to liquid or gaseous fuels, but includes coal consumed in transformation processes.

†Less than 0.05%.

♦Less than 0.05%.

**Notes:** Differences between these world consumption figures and the world production statistics are accounted for by stock changes, and unavoidable disparities in the definition, measurement or conversion of coal supply and demand data.

**Growth rates are adjusted for leap years.**

### Production by region

Million tonnes oil equivalent

### Consumption by region

Million tonnes oil equivalent

World coal production increased by 0.8% in 2013, well below the 3% increase in global consumption. Indonesia (+9.4%) recorded the largest production increment – the first time since 1998 that China did not have the largest growth increment. Global consumption growth was below average but was once again the fastest among fossil fuels. China and India accounted for 88% of global growth.

\*Based on gross primary generation and not accounting for cross-border electricity supply. Converted on the basis of thermal equivalence assuming 38% conversion efficiency in a modern thermal power station.

†Less than 0.05.

♦Less than 0.05%.

Notes: Hydroelectricity data expressed in terawatt-hours is available at [bp.com/statisticalreview](http://bp.com/statisticalreview)  
Growth rates are adjusted for leap years.

### Nuclear energy consumption by region

Million tonnes oil equivalent

### Hydroelectricity consumption by region

Million tonnes oil equivalent

World nuclear power generation increased by 0.9%, the first increase since 2010. Gains in the US, China, and Canada more than offset declines in South Korea, Ukraine, Spain and Russia. Global hydroelectric output grew by a below-average 2.9%. Growth in China, Russia, Spain and India was partly offset by large declines in Brazil and the Nordic countries.

### Other renewables consumption by region

Million tonnes oil equivalent

### Other renewables share of power generation by region

Percentage

Renewable energy in power generation grew by an above-average 16.3% in 2013. Europe & Eurasia once again contributed the largest growth increment, even though growth in Europe's leading players – Germany, Spain, and Italy – was below average. China contributed the largest national increment. Renewable energy accounted for more than 5% of global electricity production for the first time, and 15% of EU power generation.

Notes: Consumption of fuel ethanol and biodiesel is included in oil consumption tables. Growth rates are adjusted for leap years.

Source: Includes data from F.O. Lichts; US Energy Information Administration.

## World biofuels production

Million tonnes oil equivalent

World biofuels production increased by 6.1% in 2013. Increased biofuels output in North America, South and Central America and Asia Pacific outweighed declines in Europe and Eurasia. Global ethanol production increased 6.1%, the first increase in two years. Biodiesel production increased 6.2%, despite declines in South and Central America and Europe and Eurasia.

# ① Primary energy

## World consumption

Million tonnes oil equivalent

World primary energy consumption grew by a below-average 2.3% in 2013, a third consecutive below-average increase. Growth was below average in all regions except North America. All fuels except oil, nuclear and renewables grew at below-average rates. Oil remains the world's dominant fuel, but has lost market share for 14 years in a row. Hydroelectric and other renewables in power generation both reached record shares of global primary energy consumption (6.7% and 2.2%, respectively).

## Regional consumption pattern 2013

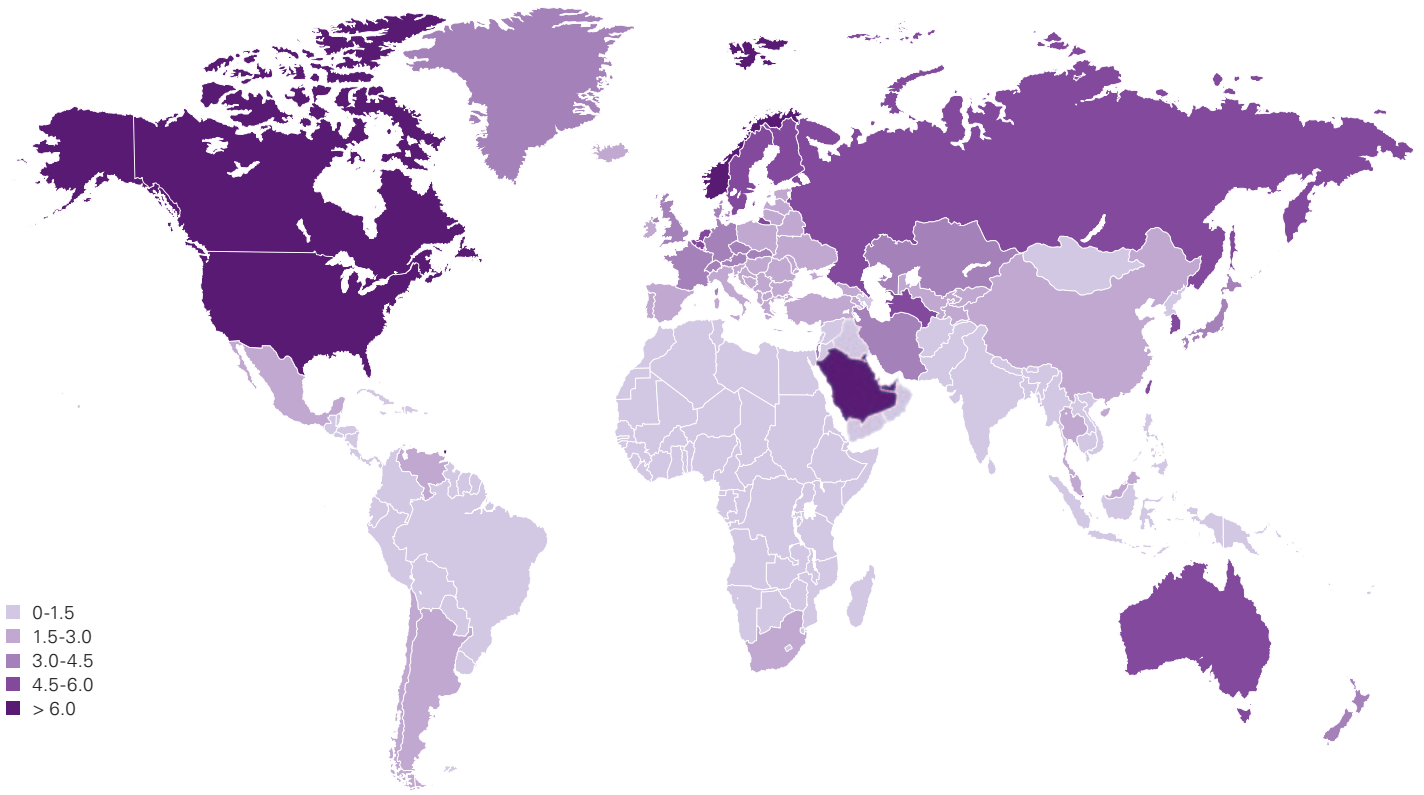

Percentage

The Asia Pacific region once again accounted for the largest increment to global primary energy consumption and continues to account for the largest share (40.5% of the global total). The region accounted for over 70% of global coal consumption for the first time in 2013, and coal remains the region's dominant fuel. Oil is the dominant fuel in all other regions except Europe & Eurasia and the Middle East where gas is dominant. In the Middle East, gas surpassed oil as the dominant fuel in 2013.

## Consumption per capita 2013

Tonnes oil equivalent

## Fossil fuel reserves-to-production (R/P) ratios at end 2013

Years

Coal remains – by far – the most abundant fossil fuel by R/P ratio. Non-OECD countries hold the majority of proved reserves for all fossil fuels, and the highest R/P ratios for oil and natural gas. By region, the Middle East holds the largest reserves for oil and natural gas, and the highest R/P ratio for natural gas; South and Central America hold the highest R/P ratio for oil. Europe & Eurasia holds the largest coal reserves, and the highest R/P ratio.

## Definitions

Statistics published in this review are taken from government sources and published data. No use is made of confidential information obtained by BP in the course of its business.

Country and geographic groupings are made purely for statistical purposes and are not intended to imply any judgement about political or economic standings.

#### North America

US (excluding Puerto Rico), Canada, Mexico.

#### South & Central America

Caribbean (including Puerto Rico), Central and South America.

#### Europe

European members of the OECD plus Albania, Bosnia-Herzegovina, Bulgaria, Croatia, Cyprus, Former Yugoslav Republic of Macedonia, Gibraltar, Malta, Romania, Serbia and Montenegro.

#### Former Soviet Union

Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine, Uzbekistan.

#### Europe & Eurasia

All countries listed above under the headings Europe and Former Soviet Union.

#### Middle East

Arabian Peninsula, Iran, Iraq, Israel, Jordan, Lebanon, Syria.

#### North Africa

Territories on the north coast of Africa from Egypt to western Sahara.

#### West Africa

Territories on the west coast of Africa from Mauritania to Angola, including Cape Verde, Chad.

#### East and Southern Africa

Territories on the east coast of Africa from Sudan to Republic of South Africa. Also Botswana, Madagascar, Malawi, Namibia, Uganda, Zambia, Zimbabwe.

#### Asia Pacific

Brunei, Cambodia, China, China Hong Kong SAR\*, Indonesia, Japan, Laos, Macau, Malaysia, Mongolia, North Korea, Philippines, Singapore, South Asia (Afghanistan, Bangladesh, India, Myanmar, Nepal, Pakistan, Sri Lanka), South Korea, Taiwan, Thailand, Vietnam, Australia, New Zealand, Papua New Guinea, Oceania.

\*Special Administrative Region.

#### Australasia

Australia, New Zealand.

#### OECD members

**Europe:** Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Republic of Ireland, Italy, Luxembourg, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey, UK.

**Other member countries:** Australia, Canada, Chile, Israel, Japan, Mexico, New Zealand, South Korea, US.

#### OPEC members

**Middle East:** Iran, Iraq, Kuwait, Qatar, Saudi Arabia, United Arab Emirates.

**North Africa:** Algeria, Libya.

**West Africa:** Angola, Nigeria.

**South America:** Ecuador, Venezuela.

1 metric tonne	= 2204.62lb = 1.1023 short tons
1 kilolitre	= 6.2898 barrels = 1 cubic metre
1 kilocalorie (kcal)	= 4.187kJ = 3.968Btu
1 kilojoule (kJ)	= 0.239kcal = 0.948Btu
1 British thermal unit (Btu)	= 0.252kcal = 1.055kJ
1 kilowatt-hour (kWh)	= 860kcal = 3600kJ = 3412Btu

### Calorific equivalents

One tonne of oil equivalent equals approximately:

<b>Heat units</b>	10 million kilocalories 42 gigajoules 40 million British thermal units
<b>Solid fuels</b>	1.5 tonnes of hard coal 3 tonnes of lignite
<b>Gaseous fuels</b>	See Natural gas and liquefied natural gas table
<b>Electricity</b>	12 megawatt-hours

One million tonnes of oil or oil equivalent produces about 4400 gigawatt-hours (= 4.4 terawatt-hours) of electricity in a modern power station.

1 barrel of ethanol = 0.57 barrel of oil  
1 barrel of biodiesel = 0.88 barrel of oil

### European Union members

Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Republic of Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, UK.

### Non-OECD

All countries that are not members of the OECD.

### Methodology

The primary energy values of nuclear and hydroelectric power generation, as well as electricity from renewable sources, have been derived by calculating the equivalent amount of fossil fuel required to generate the same volume of electricity in a thermal power station, assuming a conversion efficiency of 38% (the average for OECD thermal power generation).

Fuels used as inputs for conversion technologies (gas-to-liquids, coal-to-liquids and coal-to-gas) are counted as production for the source fuel and the outputs are counted as consumption for the converted fuel.

### Percentages

Calculated before rounding of actuals. All annual changes and shares of totals are on a weight basis except on pages 6, 13, 16, 18 and 20.

### Rounding differences

Because of rounding, some totals may not agree exactly with the sum of their component parts.

### Tonnes

Metric equivalent of tons.

## More information

### Questions on data

BP regrets it is unable to deal with enquiries about the data in *BP Statistical Review of World Energy 2014*.

### Quoting from the review

Publishers are welcome to quote from this review provided that they attribute the source to *BP Statistical Review of World Energy 2014*. However, where extensive reproduction of tables and/or charts is planned, permission must first be obtained from:
